About This Guide

Purpose

This guide explains how to use the Simba Java SQL Engine to document what SQL grammar the JSQL engine supports.

Audience

The guide is intended for developers who have created a connector with the Simba Java SQL Engine. This guide is also intended for end users of the Simba Java SQL Engine.

Knowledge Prerequisites

To use the Simba Java SQL Engine, the following knowledge is helpful:

- Familiarity with the platform on which you are using the Simba Java SQL Engine.
- Ability to use the data store to which the Simba Java SQL Engine is connecting.
- An understanding of the role of ODBC or JDBC technologies and driver managers in connecting to a data store.
- Experience creating and configuring ODBC or JDBC connections.

Variables Used in this Document

The following variables are used in this document:

Variable	Description
<code>[DRIVER_NAME]</code>	The name of your connector, as used in Windows registry keys and names of configuration files.
<code>[INSTALL_DIR]</code>	Installation directory for the Simba Java SQL Engine.

Introducing the Simba Java SQL Engine

An ODBC SQL Parsing and Execution Engine for Database Access, Simba Java SQL Engine is a component of SimbaEngine. It provides SQL processing in data drivers and data providers for non-SQL data stores built with SimbaEngine. Simba Java SQL Engine can also be used in custom solutions where SQL parsing or execution is required.

About

Simba Java SQL Engine is an easy-to-use, complete, high-performance SQL parser and execution engine for building ODBC, JDBC, ADO.NET or OLE DB data access solutions for non-SQL data stores. You can use it with other SimbaEngine components to create either local or remote data driver access to non-SQL data sources – such as web service, object-oriented, network, real time (e.g. SCADA) and ISAM databases – or you can use it in a custom solution and call it from your own code. Simba SQL Engine's clean and logical interfaces make it easy to work with, and it can either parse, or parse and execute a SQL statement and retrieve the result set. Included with the SimbaEngine is the Java Quickstart ODBC driver that is a working example of a JDBC driver built using SQL Engine that you can modify to demonstrate reading your own data in just a few days.

The Simba Java SQL Engine parser conforms to the SQL-92 specification, but it can be extended to implement any SQL function or feature. When Simba Java SQL Engine prepares a SQL statement, it validates the tables and columns referenced in the statement against the metadata from the underlying data store. Then it creates an intermediate version of the query called the Algebraic Expression Tree (AE-Tree).

The AE-Tree represents the metadata for the query, and is eventually transformed into an Execution Tree (E-Tree), which can be executed. By carefully moving or modifying nodes, the AE-Tree can be updated to change the way the query is executed without changing the result. The underlying data store can modify the AE-Tree, so that when the query is executed, Simba Java SQL Engine delegates some or all of the processing to the underlying data store. We call this Collaborative Query Execution. The advantage is that any high-performance processing available in the data store is available for use with Simba Java SQL Engine. If the entire query can be delegated, Simba Java SQL Engine will only retrieve the result set. This is particularly important for analytical databases with built-in, high-performance aggregation processing that end users expect to see even through JDBC.

Simba Java SQL Engine is a complete, compatible, high-performance and easy to use solution for SQL processing on non-SQL data stores. Everything you need to prepare and execute SQL queries is included with a clean and logical interface. With compliance to the SQL-92 standard, it is carefully designed to support common reporting and BI tools, so end users can get on with their work. Collaborative Query Execution allows you to use the high-performance processing built into your own data store to boost the performance of Simba Java SQL Engine. You can use Simba Java SQL Engine with the other components of SimbaEngine to quickly deploy local or remote data access, or you can use it alone, called from your own code. However you choose to deploy it, Simba Java SQL Engine is the easiest and most flexible SQL preparation and execution engine available today.

This flow of control is illustrated below:

Specifications

The following list details the specifications for the Simba Java SQL Engine:

- SQL-92-compliant parser with comprehensive support for ODBC 3.80-compliant data types, as well as scalar and aggregate functions, except interval types
- Maximum number of simultaneous connections limited only by memory.
- Maximum result set length limited only by memory and swap table space.
- Maximum 65,356 columns supported in a select list.
- Maximum 65,356 columns supported in a table.
- Maximum number of characters in a SQL statement is configurable and is only limited by memory.
- Maximum number of joined tables limited only by memory and swap table space.

SQL Engine Parser

The following is a list of commands that the SQL Engine Parser supports that the Execution component does not support. This means that a parse tree can be generated, however executing using the Execution component will fail.

- ALL PRIVILEGES
- ALTER TABLE
- CASCADE
- CREATE VIEW
- DROP VIEW
- EXCEPT
- EXCEPT ALL
- GRANT
- GRANT OPTION FOR
- PUBLIC
- REFERENCES
- RESTRICT
- REVOKE
- SET CATALOG
- SET SCHEMA
- USAGE
- WITH GRANT OPTION

SQL Engine SQL Commands

This section discusses commands that are supported by both the Parser and Execution components of the SQL Engine:

- CREATE TABLE
- CREATE VIEW
- DELETE
- DROP TABLE
- DROP VIEW
- INSERT
- SELECT
- UPDATE
- UPSERT

Functions

Simba Engine SQL has many built-in functions for performing calculations on data. There are several basic types and categories of functions. The following sections list some SQL Functions supported by Simba Engine SQL.

Aggregate Functions

An aggregate function takes a set of values (like a column of data) and returns a single value result from the set of values. As of SimbaEngine 9.3, custom aggregates are supported (excluding the ETree), which means that any aggregate function can be supported.

Aggregate Functions	SimbaEngine SQL Supported
AVG	Yes
COUNT	Yes
MAX	Yes
MIN	Yes
SUM	Yes

Scalar Function

A scalar function takes input argument(s) and returns a single value result. Following is a list of scalar function which supported by SimbaEngine SQL. As of SimbaEngine 9.3, custom scalars are supported, which means that any scalar function can be supported.

Scalar Function	SimbaEngine SQL Supported
String Functions	
ASCII	Yes
CHAR	Yes

Scalar Function	SimbaEngine SQL Supported
CONCAT	Yes
LCASE	Yes
LEFT	Yes
LENGTH	Yes
LOCATE	Yes
LTRIM	Yes
INSERT	Yes
REPEAT	Yes
REPLACE	Yes
RIGHT	Yes
RTRIM	Yes
SOUNDEX	Yes
SPACE	Yes
SUBSTRING	Yes
UCASE	Yes
BIT_LENGTH	No
CHAR_LENGTH	No
CHARACTER_LENGTH	No

Scalar Function	SimbaEngine SQL Supported
DIFFERENCE	No
OCTET_LENGTH	No
POSITION(_IN_)	No
Numeric Functions	
ABS	Yes
ACOS	Yes
ASIN	Yes
ATAN	Yes
ATAN2	Yes
CEILING	Yes
COS	Yes
COT	Yes
DEGREES	Yes
EXP	Yes
FLOOR	Yes
LOG	Yes
LOG10	Yes
MOD	Yes

Scalar Function	SimbaEngine SQL Supported
PI	Yes
POWER	Yes
RADIANS	Yes
RAND	Yes
ROUND	Yes
SIGN	Yes
SIN	Yes
SQRT	Yes
TAN	Yes
TRUNCATE	Yes
System Functions	
CAST	Yes
CONVERT	Yes
DATABASE	Yes
IFNULL	Yes
USER	Yes
SimbaEngine SQL	
COALESCE	Yes

Scalar Function	SimbaEngine SQL Supported
NULL	Yes
NULLIF	Yes

Date and Time Functions

The following is a table of all important Date and Time related functions available through Simba Engine SQL.

Date and Time and Interval Functions	SimbaEngine SQL Supported
CURRENT_DATE	Yes
CURRENT_TIME	Yes
CURRENT_TIME(time-precision)	Yes
CURRENT_TIMESTAMP	Yes
CURRENT_TIMESTAMP(time-precision)	Yes
CURDATE	Yes
CURTIME	Yes
DAYNAME	Yes
DAYOFMONTH	Yes
DAYOFWEEK	Yes
DAYOFYEAR	Yes
HOUR	Yes
MINUTE	Yes

Date and Time and Interval Functions SimbaEngine SQL Supported	
MONTH	Yes
MONTHNAME	Yes
NOW	Yes
DAYNAME	Yes
DAYOFMONTH	Yes
DAYOFWEEK	Yes
DAYOFYEAR	Yes
HOUR	Yes
MINUTE	Yes
MONTH	Yes
MONTHNAME	Yes
NOW	Yes
QUARTER	Yes
SECOND	Yes
TIMESTAMPDIFF	Yes
TIMESTAMPADD	Yes
WEEK	Yes
WEEK_ISO	Yes

Date and Time and Interval Functions SimbaEngine SQL Supported

YEAR	Yes
------	-----

EXTRACT	Yes
---------	-----

Joins

A SQL JOIN clause is used to combine rows from two or more tables, based on a common field between them. SimbaEngine SQL supports all the join types which show in following table:

Joins SimbaEngine SQL Supported

CROSS JOIN	Yes
------------	-----

JOIN	Yes
------	-----

INNER	Yes
-------	-----

LEFT OUTER	Yes
------------	-----

LEFT	Yes
------	-----

RIGHT OUTER	Yes
-------------	-----

RIGHT	Yes
-------	-----

FULL	Yes
------	-----

FULL OUTER	Yes
------------	-----

SELECT or Subquery Key Words

A subquery is a query within a query. A subquery is usually added in the WHERE Clause of the sql statement, and is usually used when you know how to search for a value using a SELECT statement but do not know the exact value in the database. Subqueries are an alternate way of returning data from multiple tables and can be used with the comparison operators, for example "=", "<>", "<", ">", "<=" and ">=". They may contain any of the keywords used in the SELECT statement.

The following are other keywords that can be used within a SELECT statement, in any of the associated clauses:

Subquery Key Words	SimbaEngine SQL Supported
ALL	Yes
ANY	Yes
DISTINCT	Yes
GROUP BY	Yes
HAVING	Yes
LIMIT	Yes
TOP	Yes
UNION	Yes
UNION ALL	Yes
VALUES	Yes
AS	Yes
ASC	Yes
DATATYPE (one of the SQL_* types)	Yes
TSIDATATYPE (one of the SQL_TSI_* types)	Yes
DESC	Yes
DEFAULT	Yes
WHERE	Yes

Subquery Key Words	SimbaEngine SQL Supported
OR	Yes
AND	Yes
NOT	Yes
EQ (=)	Yes
NE (<>)	Yes
LT (<)	Yes
GT (>)	Yes
LE (<=)	Yes
GE (>=)	Yes
NOT BETWEEN	Yes
BETWEEN	Yes
NOT IN	Yes
IN	Yes
NOT LIKE	Yes
LIKE	Yes
ESCAPE	Yes
IS NOT NULL	Yes
IS NULL	Yes

Subquery Key Words

SimbaEngine SQL Supported

EXISTS

Yes

Simba Engine SQL Keywords

Keywords cannot be used as identifiers (names of database objects such as columns and tables) without quoting. Simba Engine SQL reserved keywords for defining, manipulating, and accessing databases.

Appendix B: Token Definitions

This section defines the tokens for the Java SQL BNF Grammar described in Appendix A.

The following token matches the pattern:

T_APPROX_NUM_LIT

```
{{DecNumLit}}|{{USInt}} ("E"|"e") ("+"|"-" )?{{USInt}}
```

T_BIB

```
{sqOpen} ({{didletter}}|{{dq}})+{sqClose}
```

T_CALL

```
(c|C) (a|A) (l|L) (l|L)
```

T_CHAR_STR_LIT

```
{{Chars}}|'"'|"\"") *
```

T_DATATYPE

```
"SQL" ("_"{{letter}})+
```

T_DECNUM_LIT

```
(({{USInt}}"."{{USInt}})|({{USInt}}".")|("."{{USInt}}))
```

T_FN

```
(f|F) (n|N)
```

T_HEX_LIT

```
0 (x|X) [a-fA-F0-9] *
```

T_IDENTIFIER

```
{{letter}}|"_") ({{letter}}|{{digit}}|"_") *
```

If an identifier matches one of the following strings (case-insensitive), it's mapped to the associated token in the following table:

Identifier	Token
"ADD"	T_ADD

Identifier	Token
"AND"	T_AND
"ANY"	T_ANY
"ALL"	T_ALL
"ALTER"	T_ALTER
"AS"	T_AS
"ASC"	T_ASC
"AVG"	T_AVG
"BETWEEN"	T_BETWEEN
"BY"	T_BY
"CASCADE"	T_CASCADE
"CASE"	T_CASE
"CAST"	T_CAST
"CATALOG"	T_CATALOG
"COALESCE"	T_COALESCE
"COLUMN"	T_COLUMN
"CONVERT"	T_CONVERT
"COUNT"	T_COUNT
"CREATE"	T_CREATE

Identifier	Token
"CROSS"	T_CROSS
"CURRENT_DATE"	T_CURRENT_DATE
"CURRENT_TIME"	T_CURRENT_TIME
"CURRENT_TIMESTAMP"	T_CURRENT_TIMESTAMP
"DATE"	T_DATE
"DAY"	T_DAY
"DAYOFWEEK"	T_DAYOFWEEK
"DEFAULT"	T_DEFAULT
"DELETE"	T_DELETE
"DESC"	T_DESC
"DISTINCT"	T_DISTINCT
"DROP"	T_DROP
"ELSE"	T_ELSE
"END"	T_END
"ESCAPE"	T_ESCAPE
"EXCEPT"	T_EXCEPT
"EXISTS"	T_EXISTS
"EXTRACT"	T_EXTRACT

Identifier	Token
"FORMAT"	T_FORMAT
"FROM"	T_FROM
"FULL"	T_FULL
"GRANT"	T_GRANT
"GROUP"	T_GROUP
"HAVING"	T_HAVING
"HOUR"	T_HOUR
"IN"	T_IN
"INDEX"	T_INDEX
"INNER"	T_INNER
"INSERT"	T_INSERT
"INTERVAL"	T_INTERVAL
"INTO"	T_INTO
"IS"	T_IS
"JOIN"	T_JOIN
"KEY"	T_KEY
"LEFT"	T_LEFT
"LIMIT"	T_LIMIT

Identifier	Token
"MAX"	T_MAX
"MIN"	T_MIN
"MINUTE"	T_MINUTE
"MONTH"	T_MONTH
"NULL"	T_NULL
"NULLIF"	T_NULLIF
"ON"	T_ON
"OPTION"	T_OPTION
"OR"	T_OR
"ORDER"	T_ORDER
"OUTER"	T_OUTER
"POSITION"	T_POSITION
"PRIMARY"	T_PRIMARY
"PRIVILEGES"	T_PRIVILEGES
"PUBLIC"	T_PUBLIC
"QUARTER"	T_QUARTER
"REFERENCES"	T_REFERENCES
"RESTRICT"	T_RESTRICT

Identifier	Token
"REVOKE"	T_REVOKE
"RIGHT"	T_RIGHT
"SCHEMA"	T_SCHEMA
"SECOND"	T_SECOND
"SELECT"	T_SELECT
"SET"	T_SET
"SOME"	T_SOME
"STDDEV"	T_STDDEV
"STDDEV_POP"	T_STDDEV_POP
"SUM"	T_SUM
"TABLE"	T_TABLE
"THEN"	T_THEN
"TIME"	T_TIME
"TIMESTAMP"	T_TIMESTAMP
"TIMESTAMPADD"	T_TIMESTAMPADD
"TIMESTAMPDIFF"	T_TIMESTAMPDIFF
"TO"	T_TO
"TOP"	T_TOP

Identifier	Token
"UNION"	T_UNION
"UNIQUE"	T_UNIQUE
"UPSERT"	T_UPSERT
"USAGE"	T_USAGE
"USER"	T_USER
"VALUES"	T_VALUES
"VAR"	T_VAR
"VAR_POP"	T_VAR_POP
"VIEW"	T_VIEW
"WEEK"	T_WEEK
"WHEN"	T_WHEN
"WHERE"	T_WHERE
"WITH"	T_WITH
"YEAR"	T_YEAR
{" "}	T_CONCAT
"="	T_EQ
">="	T_GE
">"	T_GT

Identifier	Token
"<"	T_LT
"<="	T_LE
"<>" "!="	T_NE

T_LIKE

```
(l|L) (i|I) (k|K) (e|E)
```

T_NOT

```
(n|N) (o|O) (t|T)
```

T_NOTLIKE

```
{Not}{white}+{Like}
```

T_TSIDATATYPE

```
(S|s) (Q|q) (L|l) "_" (T|t) (S|s) (I|i) "_" ({letter}|"_") *
```

T_USINT_LIT

```
{digit}+
```
